

CYBERSECURITY TRAINING

(WEEK 2 – Day1)

Social Engineering

Social engineering is the act of manipulating people into revealing confidential information or performing actions that compromise security. It exploits human psychology rather than technical vulnerabilities.

1. Phishing

- Involves sending **fraudulent emails, messages, or websites** that appear legitimate.
- Goal: Trick users into clicking malicious links, downloading malware, or revealing

sensitive data (e.g., passwords, credit card numbers).

2.Baiting

- Entices victims with **offers like free software, music, or prizes**.
- When the victim takes the "bait", they may unknowingly install malware or give away credentials.
- Example: Plugging in a free USB drive that installs a keylogger.

3.Camphish (*Camera + Phishing*)

- A technique where attackers **trick victims into turning on their webcam** or clicking a malicious video link.
- Used for **blackmail, spying, or stealing sensitive visual information**.
